

Abstract of the Disclosure

A device powered by solar or wind energy that produces multicolored lighting effects by virtue rotation or movement caused by air currents or the wind. Solar cells or a electromechanical generator produce electrical energy that stored through a control circuit for use at nighttime to power a number of light emitters. Air currents induce movement of the light emitters, or movement of the entire energy storage system, with the resulting visual effect of intermixing and changing colors as the rotation or movement varies in response to the force of the air currents.
